Subject: Application for DevOps Engineer / Cloud Engineer Position

Dear Hiring Manager,

I am writing to apply for DevOps Engineer and Cloud Engineer opportunities. I hold the Certified Kubernetes Administrator (CKA) credential, earned on March 1, 2026, and bring 2+ years of hands-on experience supporting cloud infrastructure, Kubernetes platforms, CI/CD automation, and fintech environments across Microsoft Azure, AWS, Oracle Cloud Infrastructure, and on-premises systems.

In my current role at Swiffylabs, I manage end-to-end SaaS environments for fintech clients across staging, UAT, and production. I also manage on-premises infrastructure for three clients, each with separate UAT and production environments, covering setup, deployments, monitoring, troubleshooting, and operational support. My responsibilities include Kubernetes/AKS and OKD workloads, Azure account migration activities, disaster recovery readiness and validation, Azure DevOps pipelines, and secure operations.

I have built and maintained multi-stage CI/CD pipelines using Azure Pipelines, Jenkins, GitHub Actions, YAML, Python scripting, and token-based service connections. My experience also includes Docker, Linux, DNS, load balancers, SSL/TLS, Azure Monitor, Grafana, Prometheus, Mimir/Loki, and HashiCorp Vault. I use AI-assisted tools and MCP-based access patterns to accelerate troubleshooting and repetitive DevOps tasks while following controlled-access practices.

Earlier at Cygnos, I progressed from Cloud and DevOps Intern to Engineer, deploying microservices and working with AWS EC2, ECS, ECR, load balancers, GitHub, Jenkins, Docker, security scanning, and production deployments. At Jio Platforms, I supported Azure DevOps CI/CD operations and build-issue reporting. These experiences strengthened my ability to support reliable multi-cloud and hybrid environments.

I would welcome the opportunity to contribute my Kubernetes, cloud migration, disaster recovery, CI/CD, and production operations experience to your team. I am comfortable taking ownership of deployments, investigating infrastructure issues, and working with engineering teams to improve reliability and delivery.

Thank you for your time and consideration.

Sincerely,

Eswar Krishnamoorthy
